

MetaForge Fundraising Package

This package is the first-pass investor kit for MetaForge Control Console. It now separates external-facing investor materials from internal planning notes so we do not send a draft that still needs the founder/fundraising inputs filled.

Included

- [one-pager.md](#)
- [pitch-deck.md](#)
- [demo-script.md](#)
- [data-room-checklist.md](#)
- [financial-model-template.md](#)
- [business-plan.md](#)

Demo assets

- Internal demo artifact: `generated/ metaforge-control-console-demo/ index.html`
- Internal screenshot: `output/playwright/metaforge-control-console-demo.png`
- External package should use a hosted demo URL and hosted screenshot before sending to investors.

Positioning

MetaForge is presented here as a private AI task control plane for R&D teams: task intake, dispatch, execution visibility, evidence, and release gating.

Investor-facing language split

- `one-pager.md`, `pitch-deck.md`, and `demo-script.md` are the English investor-facing bundle.
- `business-plan.md` is the Chinese planning/reference version.

- If you want a single-language external packet, export only one language path and keep the other internal.

What still needs founder input before formal outreach

- founder / team bios and roles
- exact funding ask: round, amount, instrument, valuation / cap
- traction proof that can be shared externally
- public demo URL or hosted screen recording
- 12-month use-of-funds allocation
- pricing and pipeline assumptions

Next edits

- Replace placeholders with your real customer names, pricing, pipeline data, and team bios.
- Replace internal demo paths with public links or a recording before sending externally.
- Convert the deck into a PDF or slides after the narrative and ask are finalized.
